BIPOLAR ANALOG INTEGRATED CIRCUIT **μ PC1474HA, μ PC1475HA**

REMOTE CONTROL PREAMPLIFIER

DESCRIPTION

The μ PC1474HA and μ PC1475HA are silicon monolithic integrated circuit designed for remote control preamplification of infrared signals. A PIN photo diode can be directly connected to the input terminal.

The μ PC1474HA and μ PC1475HA contain a high-gain amplifier, a peak detector and an output waveform shaper which are necessary for a remote control preamplifier.

The μ PC1474HA and μ PC1475HA have improved light interference-rejection characteristics, by use of a two-stage tuning circuit.

The μ PC1474HA's output polarity is active "Low" and the μ PC1475HA's output polarity is active "High".

FEATURES

- Good immunity from light interference: Narrow band width: ± 1.3 kHz TYP.
- Operation voltage: 5 V ± 10 %
- Low power consumption: 2.4 mA TYP.
- High input sensitivity: 50 μ V_{p-p} TYP.
- Peak detector: The detector level is varied with the input signal level.
- Out terminal: Open collector output Easy to interface to other devices.
- Application: Designed for use with the μ PD1913C, μ PD1943G, μ PD6102G remote control transmitter IC.

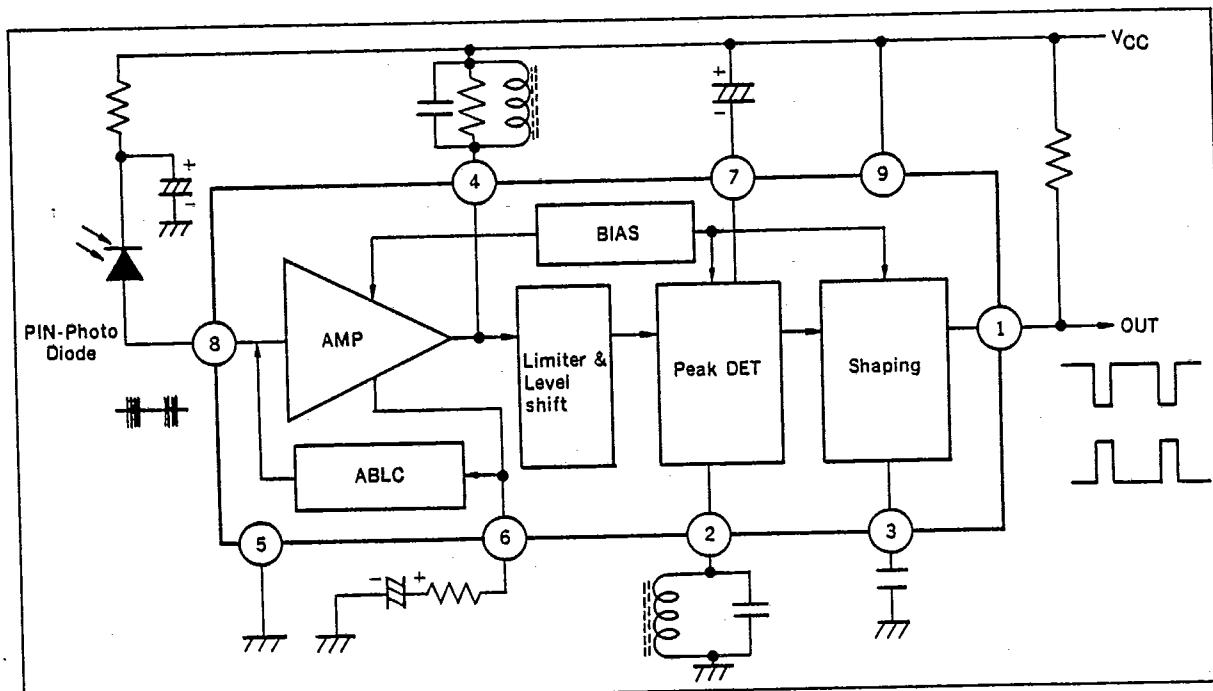

ORDERING INFORMATION

Order Code	Package	Output Data
μ PC1474HA	8-pin plastic SIP	active low
μ PC1475HA	8-pin plastic SIP	active high

STANDARD APPLICATION

T-77-11

COIL 126LNS-6285Z TOKO INC.
5 mH 0.08 φ-2 UEW313T

PIN FUNCTION

- Power supply terminal (V_{CC}: 9 Pin, GND: 5 Pin)

Operation voltage is 5 V±10 %.

In case of using a low frequency ripple voltage contained in the power supply, insert a series resistor 100 Ω between V_{CC} and power supply.

- Input terminal (IN: 8 Pin)

This input impedance is 60 kΩ TYP.

A PIN photo diode can be directly connected to this terminal.

This input has ABLC (Automatic Bias Level Control) circuit for non-saturated by violent light, so this terminal voltage is always fixed.

- 1st Stage tuning coil terminal (T₁: 4 Pin)

- Bias filter terminal (BF: 6 Pin)

This front amplifier has 52 dB gain in this application circuit and this gain is determined by tuning coil impedance (Z_L) and external resistor R6.

$$A_{vL} = \frac{Z_L}{R_{#6}}$$

When there are much impulse noise, it is better to change 10 kΩ damping resistor (4 Pin) to small one. (ex. 5 kΩ)

- Peak hold terminal (PH: 7 Pin)

The signal of tuning coil terminal is detected by peak detector circuit.

T-77-11

In this case, detecting level depend on input signal strength, so noise wave is suppressed.

Time constant of peak hold is changed by capacitor C7.

- 2nd Stage tuning coil terminal (T_2 : 2 Pin)

The peak detection signal is tuned again by this 2nd stage tuning circuit, so the band width is narrow.

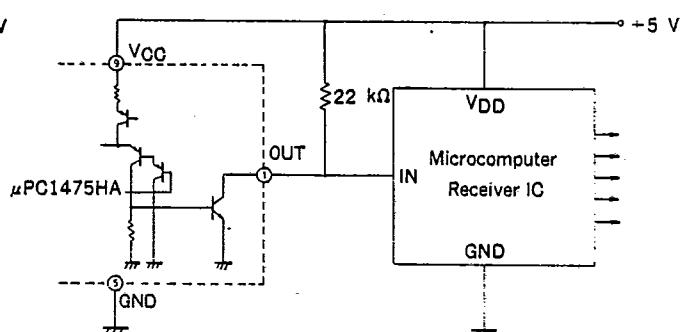

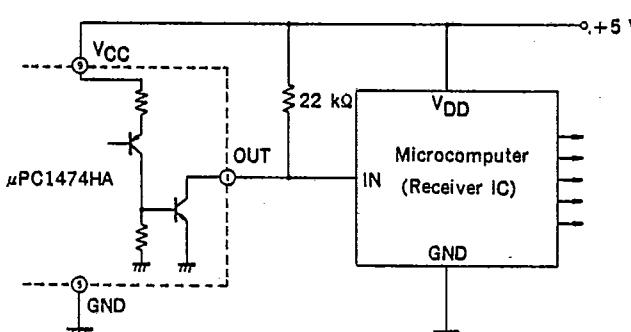

- Carrier filter terminal (CF: 3 Pin)

The carrier waveform is deleted by this capacitor C3.

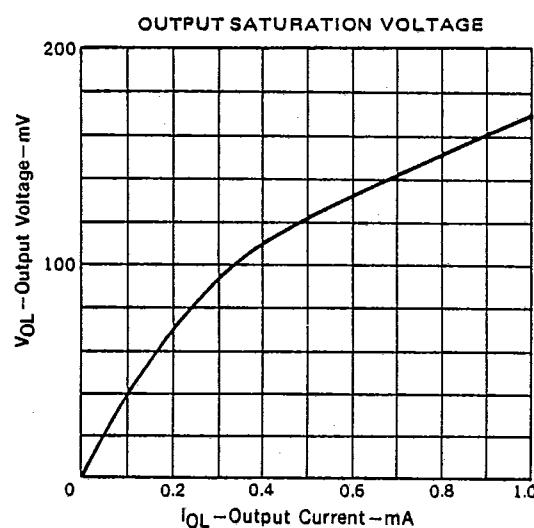

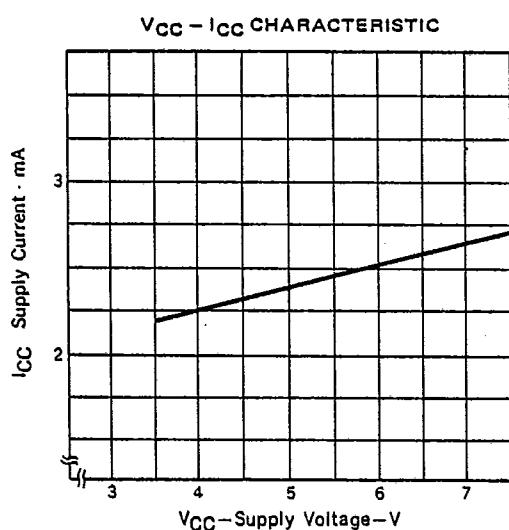

- Output terminal (OUT: 1 Pin)

This Output terminal is open collector transistor.

The μ PC1474HA is active "Low" output. The μ PC1475HA is active "High" output.
